

Introduction

This is a direct port of the [chia bls typescript library](#)[↗]. Coding style and naming have been converted to C# conventions but otherwise it is very similar in API.

All of the unit tests from the original project have been ported and pass.

chia and its logo are the registered trademark or trademark of Chia Network, Inc. in the United States and worldwide.

Namespace chia.dotnet.bls

Classes

[AffinePoint](#)

Represents an affine point on an elliptic curve.

[AugSchemeMPL](#)

Provides extension methods for the AugSchemeMPL signature scheme. This is the scheme Chia uses for its signatures.

[ByteUtils](#)

Extension methods for working with byte arrays and conversions.

[Hmac](#)

Provides methods for HMAC (Hash-based Message Authentication Code) operations.

[JacobianPoint](#)

Represents a point in Jacobian coordinates on an elliptic curve. It can represent both a PublicKey and a Signature.

[KeyDerivation](#)

Provides methods for key derivation in the BLS cryptography library.

[PrivateKey](#)

Represents a private key used in BLS cryptography.

Enums

[Endian](#)

Enum representing the endianness of byte arrays.
